

Syntax Directed Translation

Syntax-Directed Definitions(SDD)

- context-free grammar together with attributes and rule
- If X is a symbol and a is one of its attributes write $X.a$
- Attributes may be of any kind: numbers, types, table references, or strings

Attribute Grammars

- An **attribute grammar** is a context free grammar with associated **semantic attributes** and **semantic rules**
- Each **grammar symbol** is associated with a set of **semantic attributes**
- Each **production** is associated with a set of **semantic rules** for computing semantic attributes

An Example - Interpretation

$L \rightarrow E \text{ '\n'}$	$\{\text{print}(E.\text{val});\}$
$E \rightarrow E_1 \text{ '+' } T$	$\{E.\text{val} := E_1.\text{val} + T.\text{val};\}$
$E \rightarrow T$	$\{E.\text{val} := T.\text{val};\}$
$T \rightarrow T_1 \text{ '*' } F$	$\{T.\text{val} := T_1.\text{val} * F.\text{val};\}$
$T \rightarrow F$	$\{T.\text{val} := F.\text{val};\}$
$F \rightarrow \text{'(' } E \text{ ')'}$	$\{F.\text{val} := E.\text{val};\}$
$F \rightarrow \textbf{digit}$	$\{F.\text{val} := \textbf{digit.val};\}$

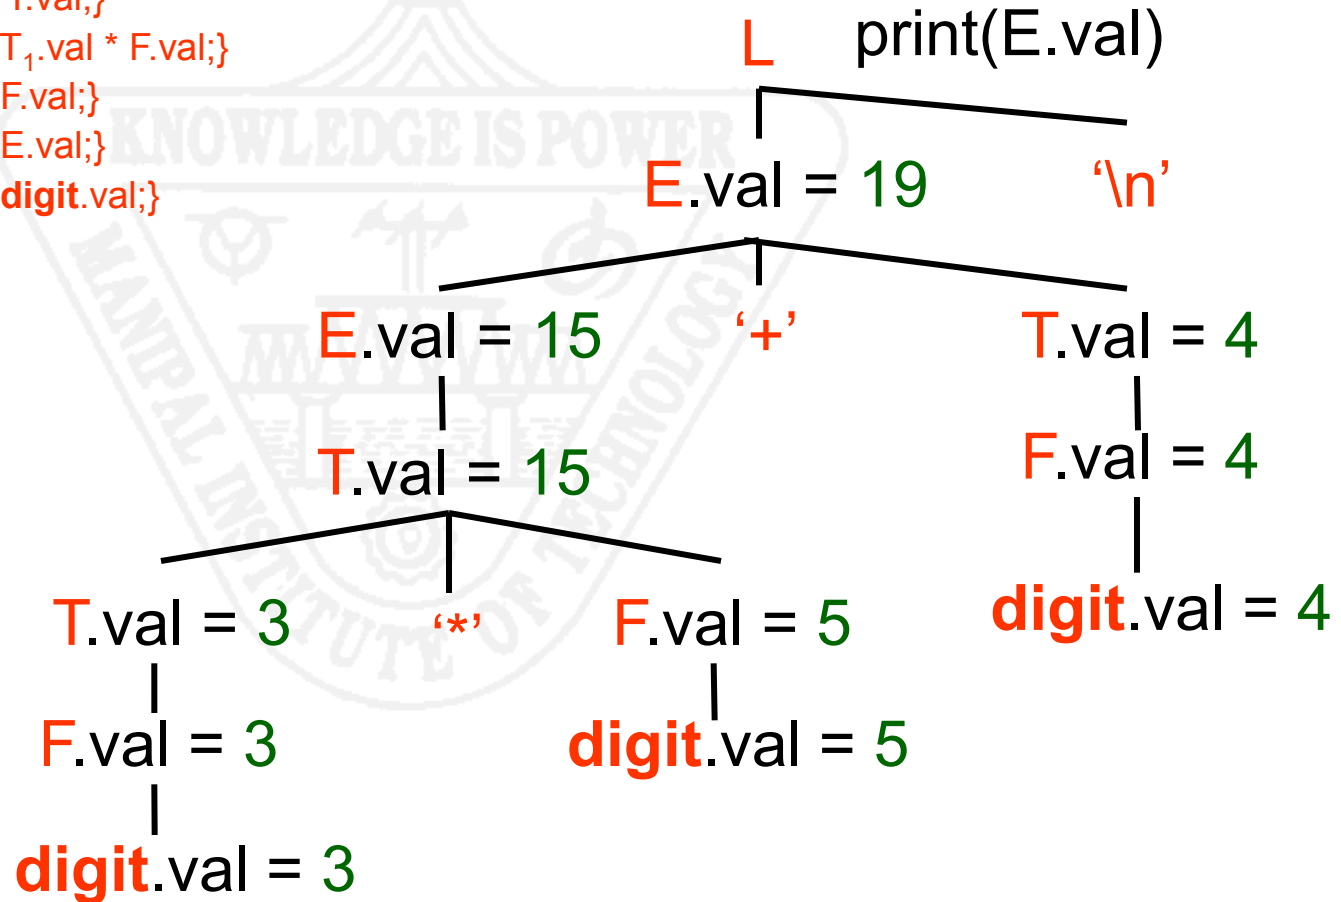

Attribute val represents the value of a construct

Annotated Parse Trees

3 * 5 + 4

$L \rightarrow E \text{ '\n'}$
 $E \rightarrow E_1 \text{ '+' } T$
 $E \rightarrow T$
 $T \rightarrow T_1 \text{ '*' } F$
 $T \rightarrow F$
 $F \rightarrow \text{'(' E '}'$
 $F \rightarrow \text{digit}$

$\{\text{print}(E.\text{val});\}$
 $\{E.\text{val} := E_1.\text{val} + T.\text{val};\}$
 $\{E.\text{val} := T.\text{val};\}$
 $\{T.\text{val} := T_1.\text{val} * F.\text{val};\}$
 $\{T.\text{val} := F.\text{val};\}$
 $\{F.\text{val} := E.\text{val};\}$
 $\{F.\text{val} := \text{digit}.\text{val};\}$

Example Annotated Parse Tree

Note: all attributes in this example are of the synthesized type

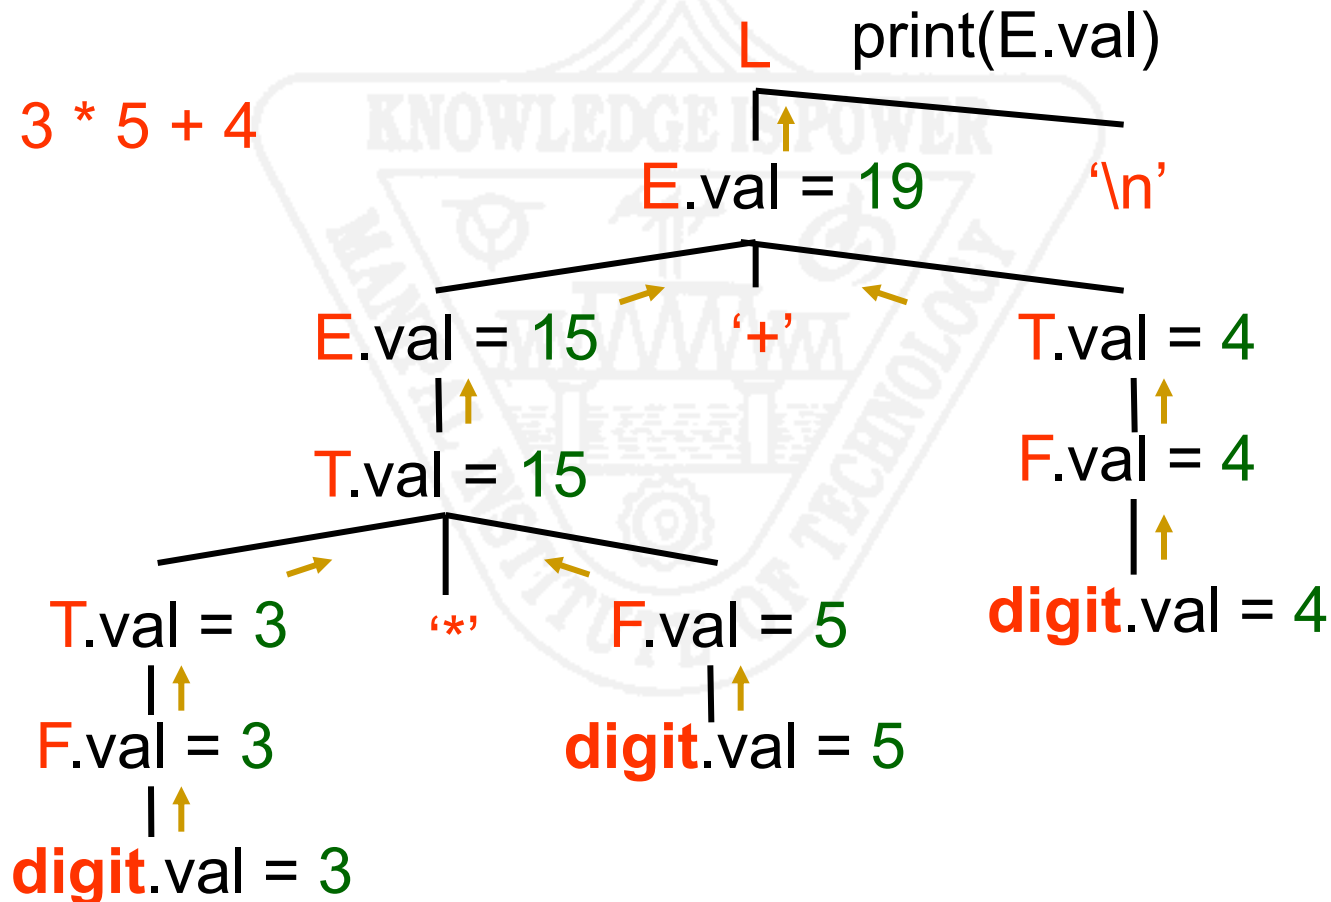

Semantic Attributes

- A (semantic) attribute of a node (grammar symbol) in the parse tree is **synthesized** if its value is computed from that of its children
- An attribute of a node in the parse tree is **inherited** if its value is computed from that of its parent and siblings

Synthesized Attributes

$L \rightarrow E \text{ '\n'}$	$\{\text{print}(E.\text{val});\}$
$E \rightarrow E_1 \text{ '+' } T$	$\{E.\text{val} := E_1.\text{val} + T.\text{val};\}$
$E \rightarrow T$	$\{E.\text{val} := T.\text{val};\}$
$T \rightarrow T_1 \text{ '*' } F$	$\{T.\text{val} := T_1.\text{val} * F.\text{val};\}$
$T \rightarrow F$	$\{T.\text{val} := F.\text{val};\}$
$F \rightarrow \text{'(' } E \text{ ')'}$	$\{F.\text{val} := E.\text{val};\}$
$F \rightarrow \text{digit}$	$\{F.\text{val} := \text{digit.val};\}$

Synthesized Attributes

Inherited Attributes

$D \rightarrow T$

$T \rightarrow \text{int}$

$T \rightarrow \text{float}$

$L \rightarrow$

$L_1 \text{ ',' id}$

$L \rightarrow \text{id}$

$\{L.in := T.type;\} L$

$\{T.type := \text{integer};\}$

$\{T.type := \text{float};\}$

$\{L_1.in := L.in;\}$

$\{\text{addtype}(\text{id.entry}, L.in);\}$

$\{\text{addtype}(\text{id.entry}, L.in);\}$

Inherited Attributes

$D \rightarrow T$

$\{L.in := T.type;\} L$

$T \rightarrow \text{int}$

$\{T.type := \text{integer};\}$

$T \rightarrow \text{float}$

$\{T.type := \text{float};\}$

$L \rightarrow$

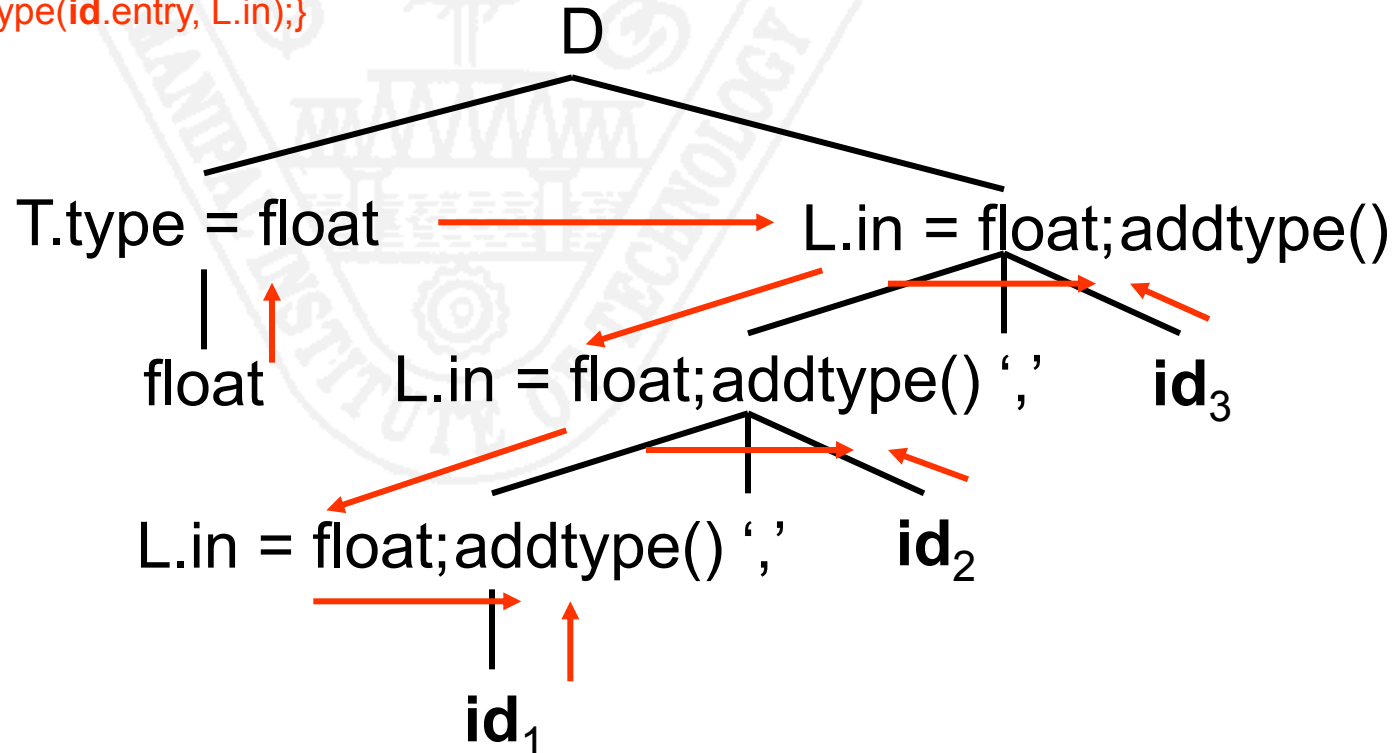

$\{L_1.in := L.in;\}$

$L_1 \text{ ',' id}$

$\{\text{addtype}(\text{id.entry}, L.in);\}$

$L \rightarrow \text{id}$

$\{\text{addtype}(\text{id.entry}, L.in);\}$

Dependencies of Attributes

- In the semantic rule
$$b := f(c_1, c_2, \dots, c_k)$$
we say b **depends on** c_1, c_2, \dots, c_k
- The semantic rule for b must be evaluated **after** the semantic rules for c_1, c_2, \dots, c_k
- The dependencies of attributes can be represented by a directed graph called **dependency graph**

Attribute Dependencies

Circular dependencies are a problem

Productions	Semantic Actions
$A \rightarrow B$	$A.s = B.i$ $B.i = A.s + 1$

S-Attributed Attribute Grammars

- An attribute grammar is **S-attributed** if it uses synthesized attributes **exclusively**

An Example

$L \rightarrow E \text{ '\n'}$	$\{\text{print}(E.\text{val});\}$
$E \rightarrow E_1 \text{ '+' } T$	$\{E.\text{val} := E_1.\text{val} + T.\text{val};\}$
$E \rightarrow T$	$\{E.\text{val} := T.\text{val};\}$
$T \rightarrow T_1 \text{ '*' } F$	$\{T.\text{val} := T_1.\text{val} * F.\text{val};\}$
$T \rightarrow F$	$\{T.\text{val} := F.\text{val};\}$
$F \rightarrow \text{'(' } E \text{ ')'}$	$\{F.\text{val} := E.\text{val};\}$
$F \rightarrow \text{digit}$	$\{F.\text{val} := \text{digit.val};\}$

L-Attributed Attribute Grammars

- An attribute grammar is **L-attributed** if each attribute computed in each semantic rule for each production

$$A \rightarrow X_1 X_2 \dots X_n$$

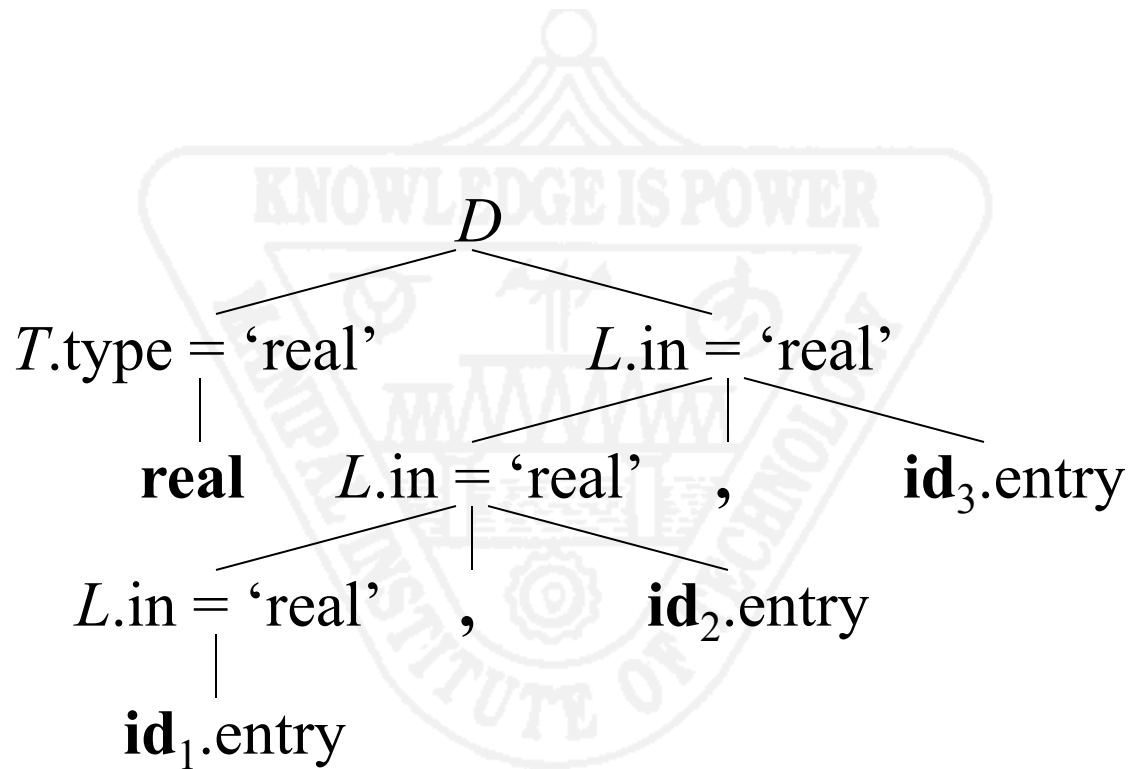

is a **synthesized** attribute, or an **inherited** attribute of X_j , $1 \leq j \leq n$, depending only on

1. the attributes of X_1, X_2, \dots, X_{j-1}
2. the inherited attributes of A

An Example

$D \rightarrow T L$ {L.in := T.type;}
 $T \rightarrow \text{int}$ {T.type := integer;}
 $T \rightarrow \text{real}$ {T.type := real;}
 $L \rightarrow L_1 \text{ ', ' id}$ {L₁.in := L.in;
addtype(id.entry, L.in);}
 $L \rightarrow \text{id}$ {addtype(id.entry, L.in);}

Example Annotated Parse Tree

Example Annotated Parse Tree with Dependency Graph

Construction of Syntax Trees

- An **abstract syntax tree** is a condensed form of **parse tree**

Syntax Trees for Expressions

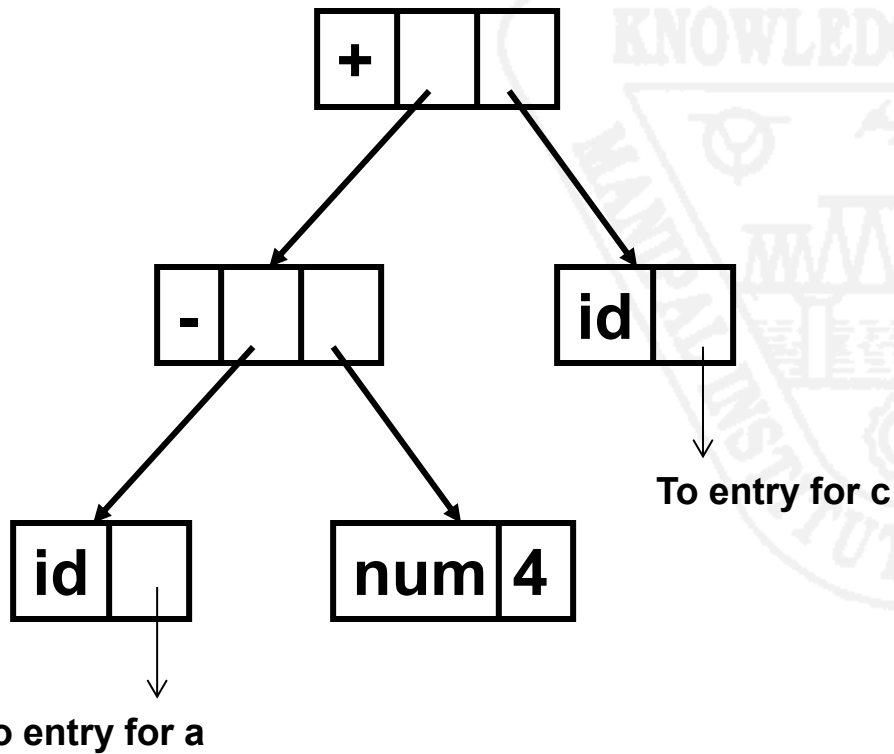

- Interior nodes are **operators**
- Leaves are **identifiers** or **numbers**
- Functions for constructing nodes
 - `node(op, c1, c2, . . . , ck)`
 - `leaf(op, val)`

An Example

$E \rightarrow E_1 '+' T$	$\{E.ptr := mknnode('+', E_1.ptr, T.ptr);\}$
$E \rightarrow E_1 '-' T$	$\{E.ptr := mknnode('-', E_1.ptr, T.ptr);\}$
$E \rightarrow T$	$\{E.ptr := T.ptr;\}$
$T \rightarrow '(' E ')'$	$\{T.ptr := E.ptr;\}$
$T \rightarrow id$	$\{T.ptr := mkleaf(id, id.entry);\}$
$T \rightarrow num$	$\{T.ptr := mkleaf(num, num.value);\}$

An Example

a - 4 + c

```
p1 := new leaf(id, entrya);  
p2 := new leaf(num, 4);  
p3 := new node('-', p1, p2);  
p4 := new leaf(id, entryc);  
p5 := new node('+', p3, p4);
```
