Line Characterizations - 2

- Parametric: $P(t) = (1-t)\,P_0 + t\,P_1$

  where, $P(0) = P_0\,; \quad P(1) = P_1$

- Intersection of 2 planes
- Shortest path between 2 points
- *Convex hull* of 2 discrete points

Line Characterizations

- Explicit: $y = mx + B$
- Implicit: $F(x, y) = ax + by + c = 0$
- Constant slope: $\frac{\Delta y}{\Delta x} = k$
- Constant derivative: $f'(x) = k$

Discrete Lines

- Lines vs. Line Segments
- What is a discrete line segment?
  - This is a relatively recent problem
  - How to generate a discrete line?

“Good” Discrete Line - 1

- No gaps in adjacent pixels
- Pixels close to ideal line
- Consistent choices; same pixels in same situations

“Good” Discrete Line - 2

- Smooth looking
- Even brightness in all orientations
- Same line for $P_0 P_1$ as for $P_1 P_0$
- Double pixels stacked up?

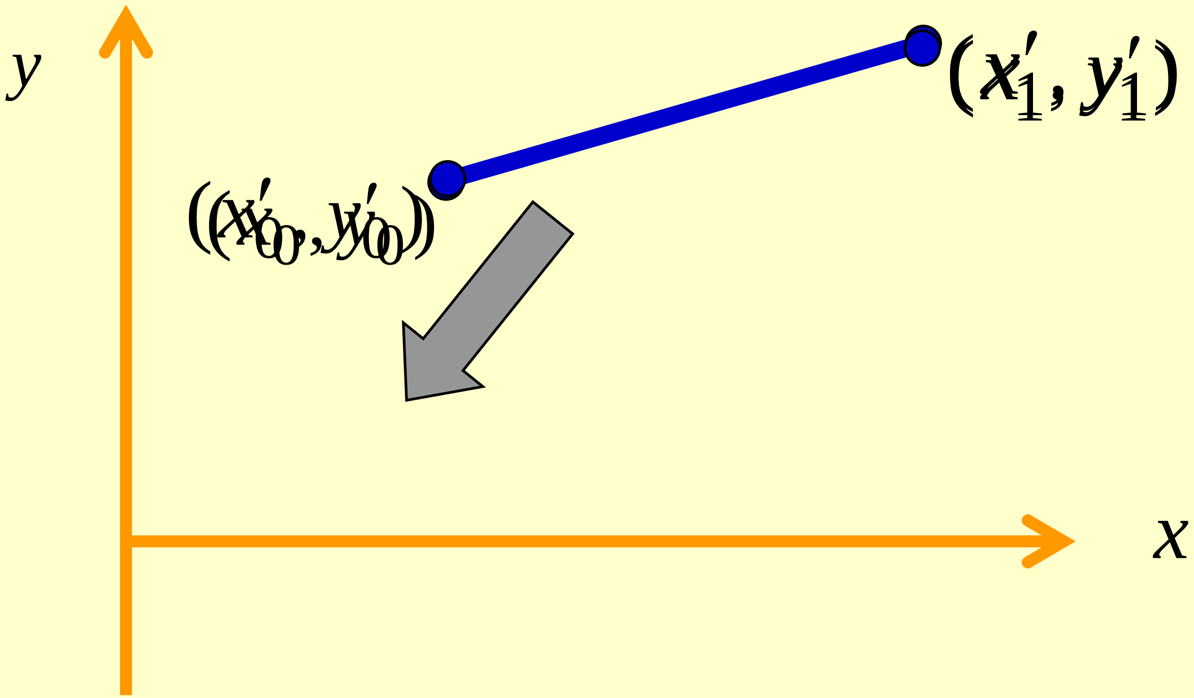
Incremental Fn Eval

- Recall $f(x_{i+1}) = f(x_i) + \Delta(x_i)$
- Characteristics
  - Fast
  - Cumulative Error
- Need to define $f(x_o)$

Meeting Bresenham Criteria

- $m = 0; \quad m = 1 \;\Rightarrow\;$ trivial cases
- $(x_0, y_0) \neq (0, 0) \;\Rightarrow\;$ translate
- $0 > m > -1 \;\Rightarrow\;$ flip about x-axis
- $m > 1 \;\Rightarrow\;$ flip about $x = y$

Case 1: Translate to Origin



Case 0: Trivial Situations

- $m = 0 \quad \Rightarrow \quad \text{horizontal line}$
- $m = 1 \quad \Rightarrow \quad \text{line } \; y = x$
- Do not need Bresenham

Case 1: Translate to Origin

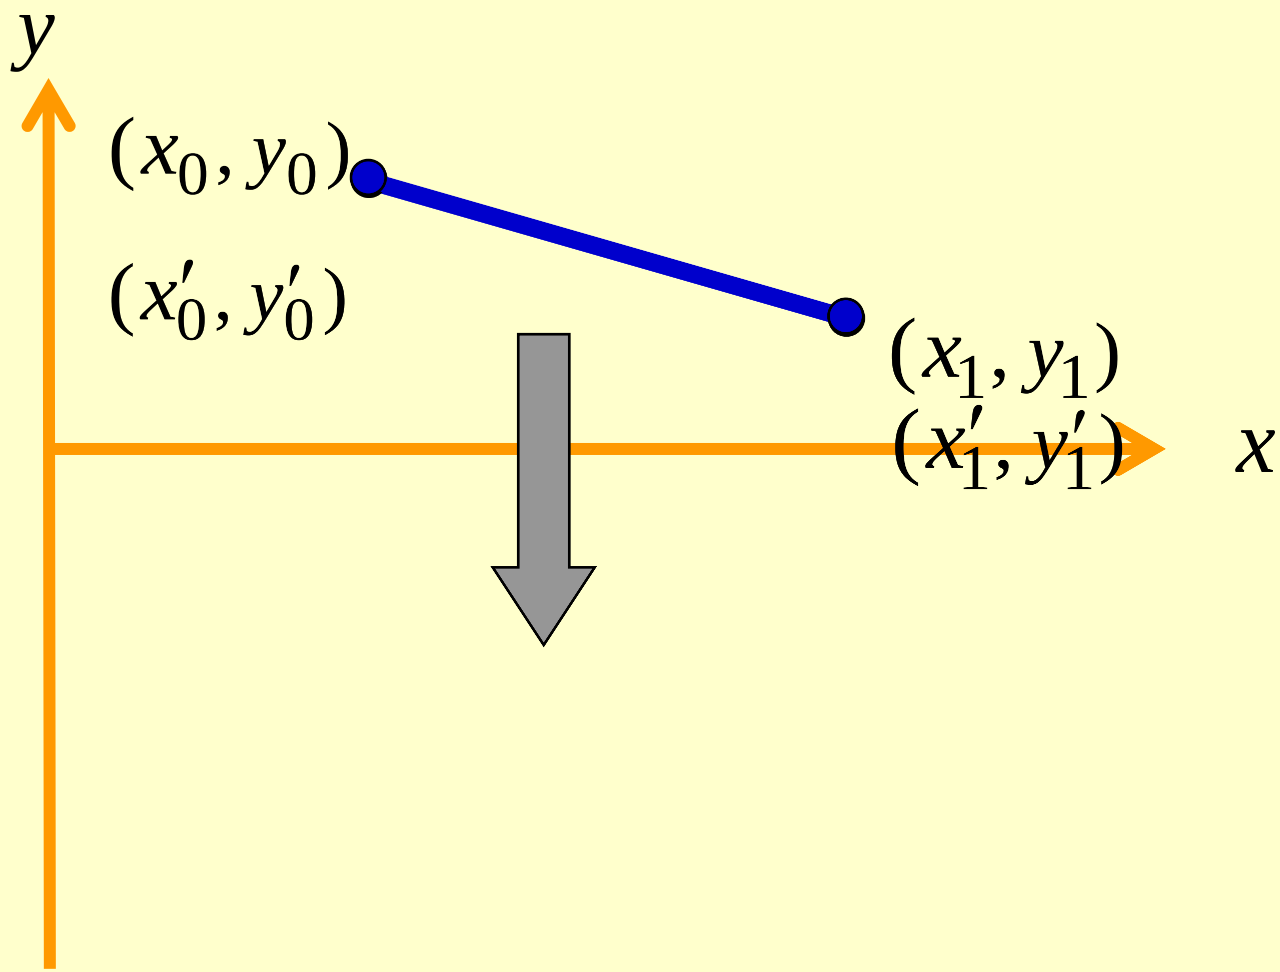
- Move (x_0, y_0) to the origin

$$(x_0', y_0') = (0,0);$$

$$(x_1', y_1') = (x_1 - x_0, y_1 - y_0)$$

- Need only consider lines emanating from the origin.

Case 2: Flip about *x-axis*



Case 2: Flip about *x-axis*

- Suppose, $0 > m > -1$,
- Flip about x-axis $(y' = -y)$:

$$(x_0', y_0') = (x_0, -y_0);$$
$$(x_1', y_1') = (x_1, -y_1)$$

How do slopes relate?

$$\left.\begin{aligned} m &= \frac{y_1 - y_0}{x_1 - x_0}; \\ m' &= \frac{y'_1 - y'_0}{x_1 - x_0} \end{aligned}\right\} \quad \text{by definition}$$

Since $y'_{\mathrm{i}} = -y_{\mathrm{i}}$, $\quad m' = \dfrac{-y_1 - (-y_0)}{x_1 - x_0}$

How do slopes relate?

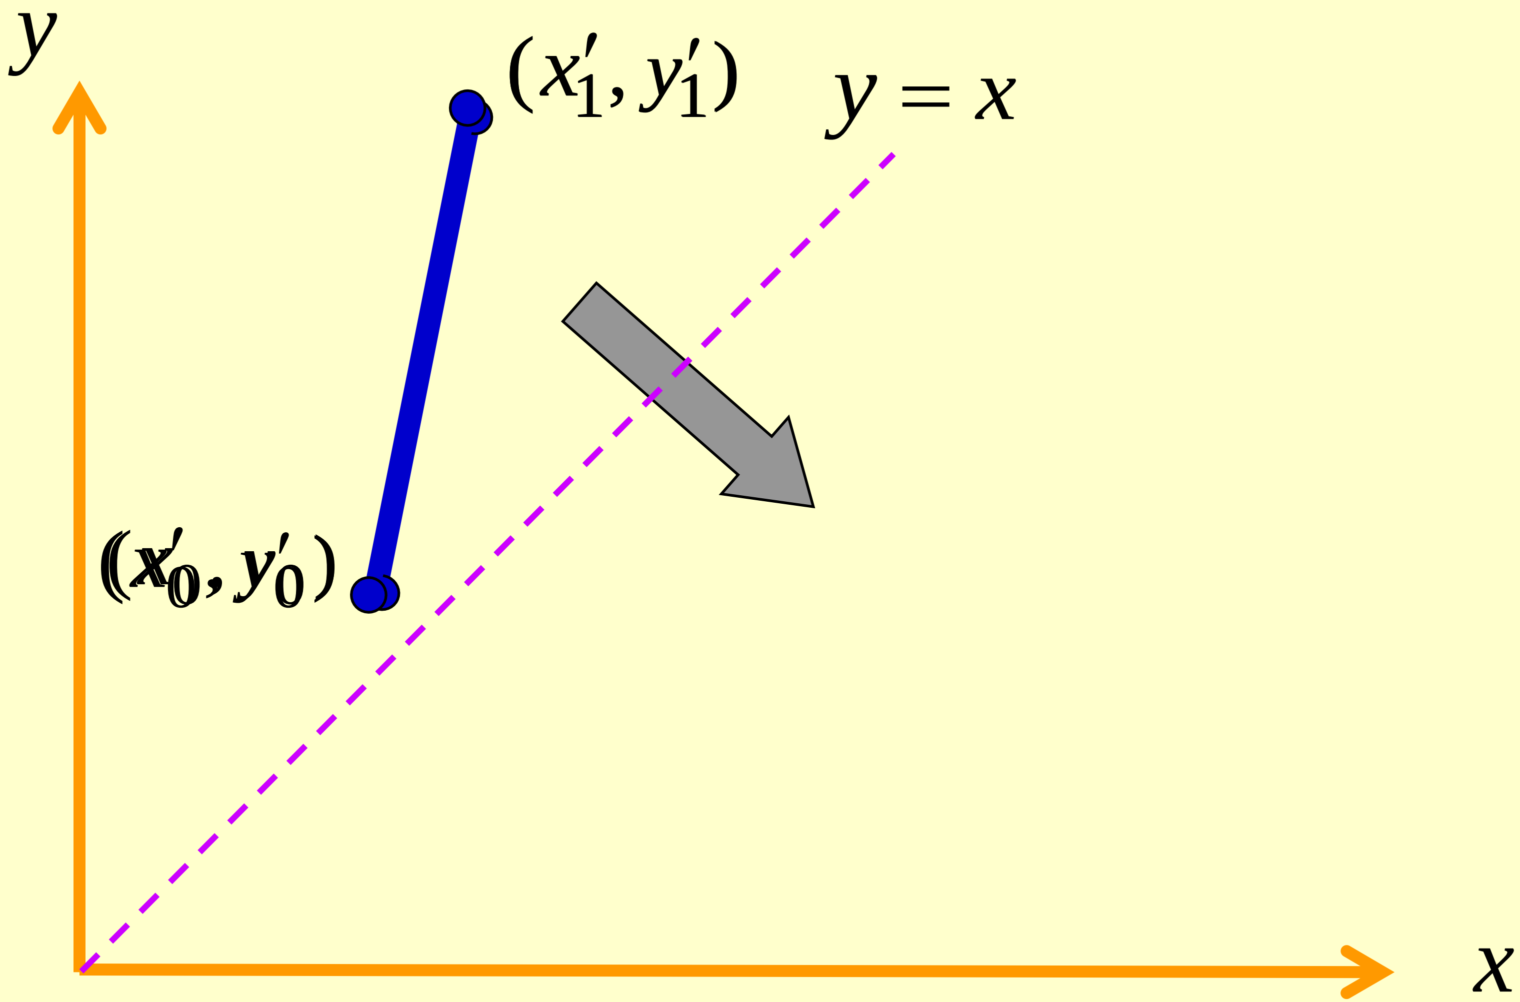
i.e.,

$$m' = -\frac{(y_1 - y_0)}{x_1 - x_0}$$

$$m' = -m$$

$$\boxed{\therefore \quad 0 > m > -1 \quad \Rightarrow \quad 0 < m' < 1}$$

Case 3: Flip about line $y = x$



Case 3: Flip about line $y = x$

$$y = mx + B,$$

swap $x \leftrightarrow y$ and prime them ,

$$x' = my' + B,$$

$$my' = x' - B$$

Case 3: $m' = ?$

$$y' = \left(\frac{1}{m}\right) x' - B,$$

$$\therefore \quad m' = \left(\frac{1}{m}\right) \quad \text{and,}$$

$$\boxed{m > 1 \quad \Rightarrow \quad 0 < m' < 1}$$

Restricted Form

- Line segment in *first* octant with

$$0 < m < 1$$

- Let us proceed

Midpoint Line Algorithm

Two Line Equations

- Explicit: $y = mx + B$
- Implicit: $F(x, y) = ax + by + c = 0$

Define: $dy = y_1 - y_0$

$dx = x_1 - x_0$

Hence, $y = \left(\dfrac{dy}{dx}\right)x + B$

From previous

We have, $$y = \left(\frac{dy}{dx}\right)x + B$$

Hence, $$\frac{dy}{dx}x - y + B = 0$$

Relating Explicit to Implicit Eq's

Recall, $\dfrac{dy}{dx}x - y + B = 0$

Or, $(dy)x + (-dx)y + (dx)B = 0$

$$\therefore \quad F(x,y) = (dy)x + (-dx)y + (dx)B = 0$$

where, $\boxed{a = (dy); \quad b = -(dx); \quad c = B(dx)}$

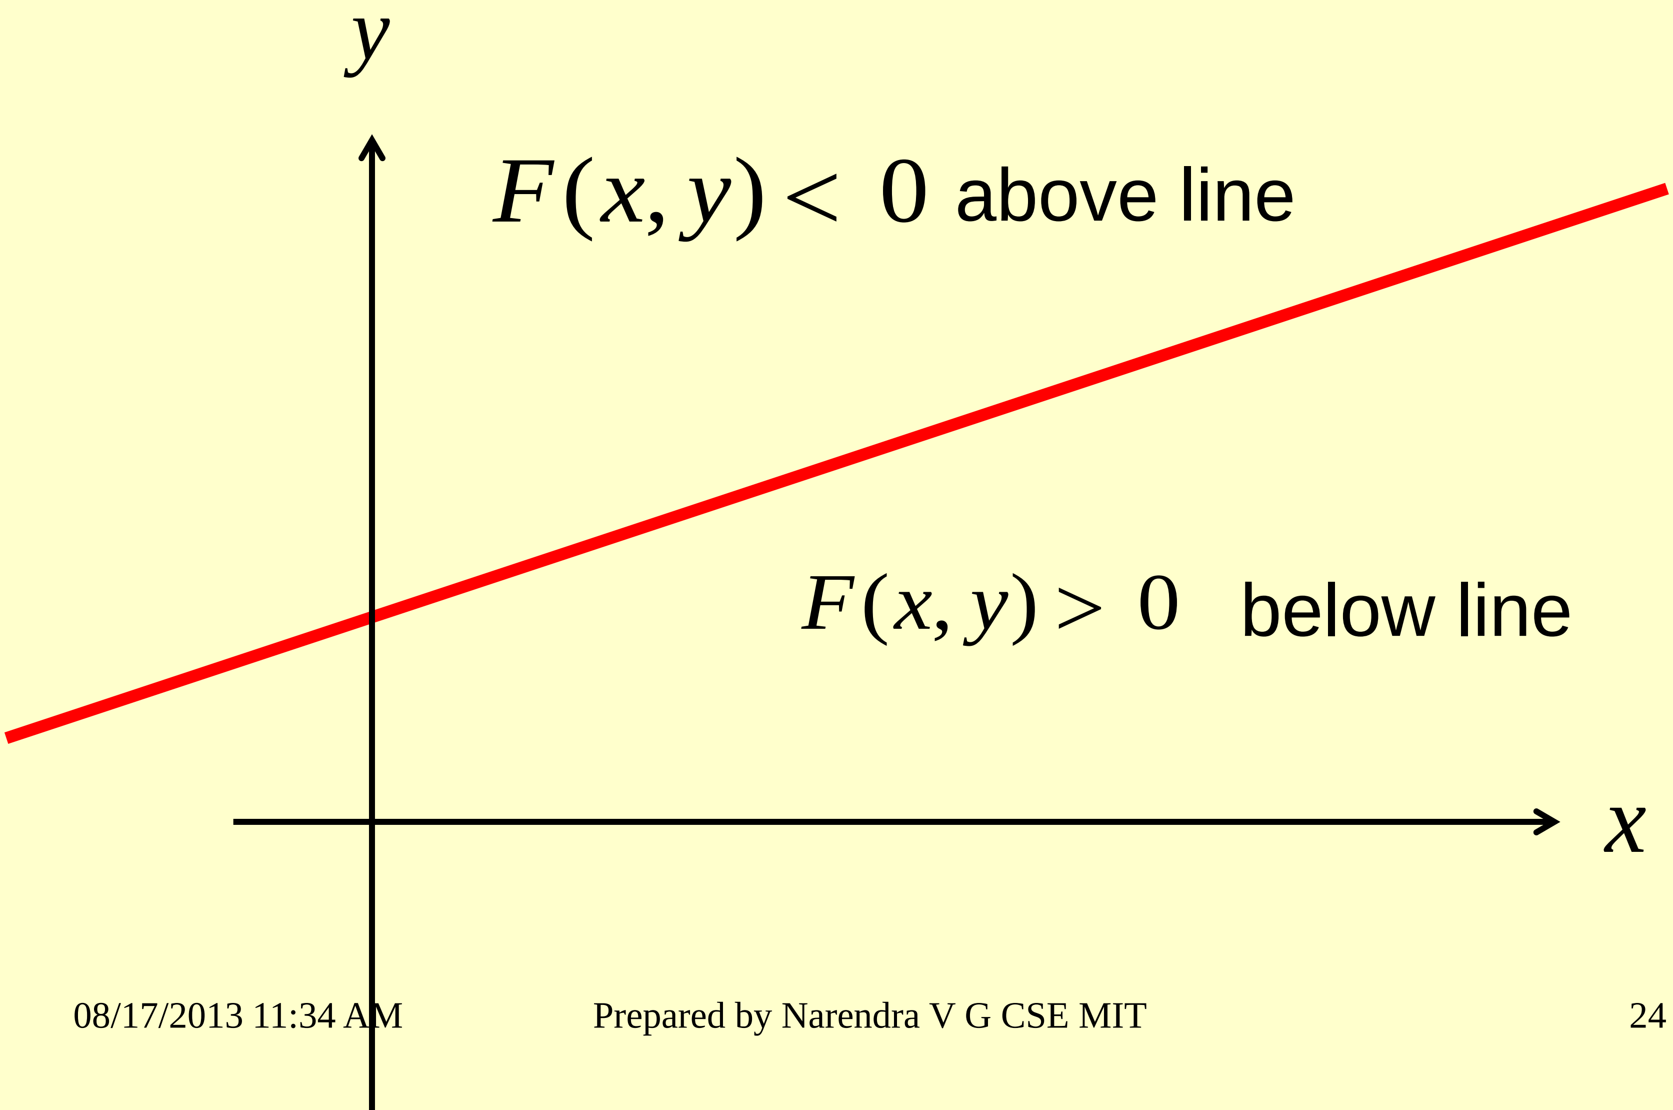
Investigate Sign of F

Verify that

$$F(x,y) = \begin{cases} + & \text{below line} \\ 0 & \text{on line} \\ - & \text{above line} \end{cases}$$

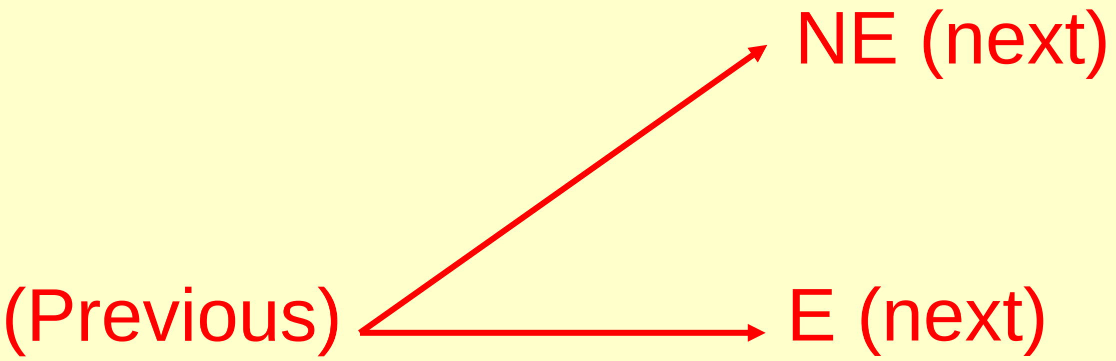
Look at extreme values of y

The Picture



Key to Bresenham Algorithm

"Reasonable assumptions" have reduced the problem to making a binary choice at each pixel:



Decision Variable d (logical)

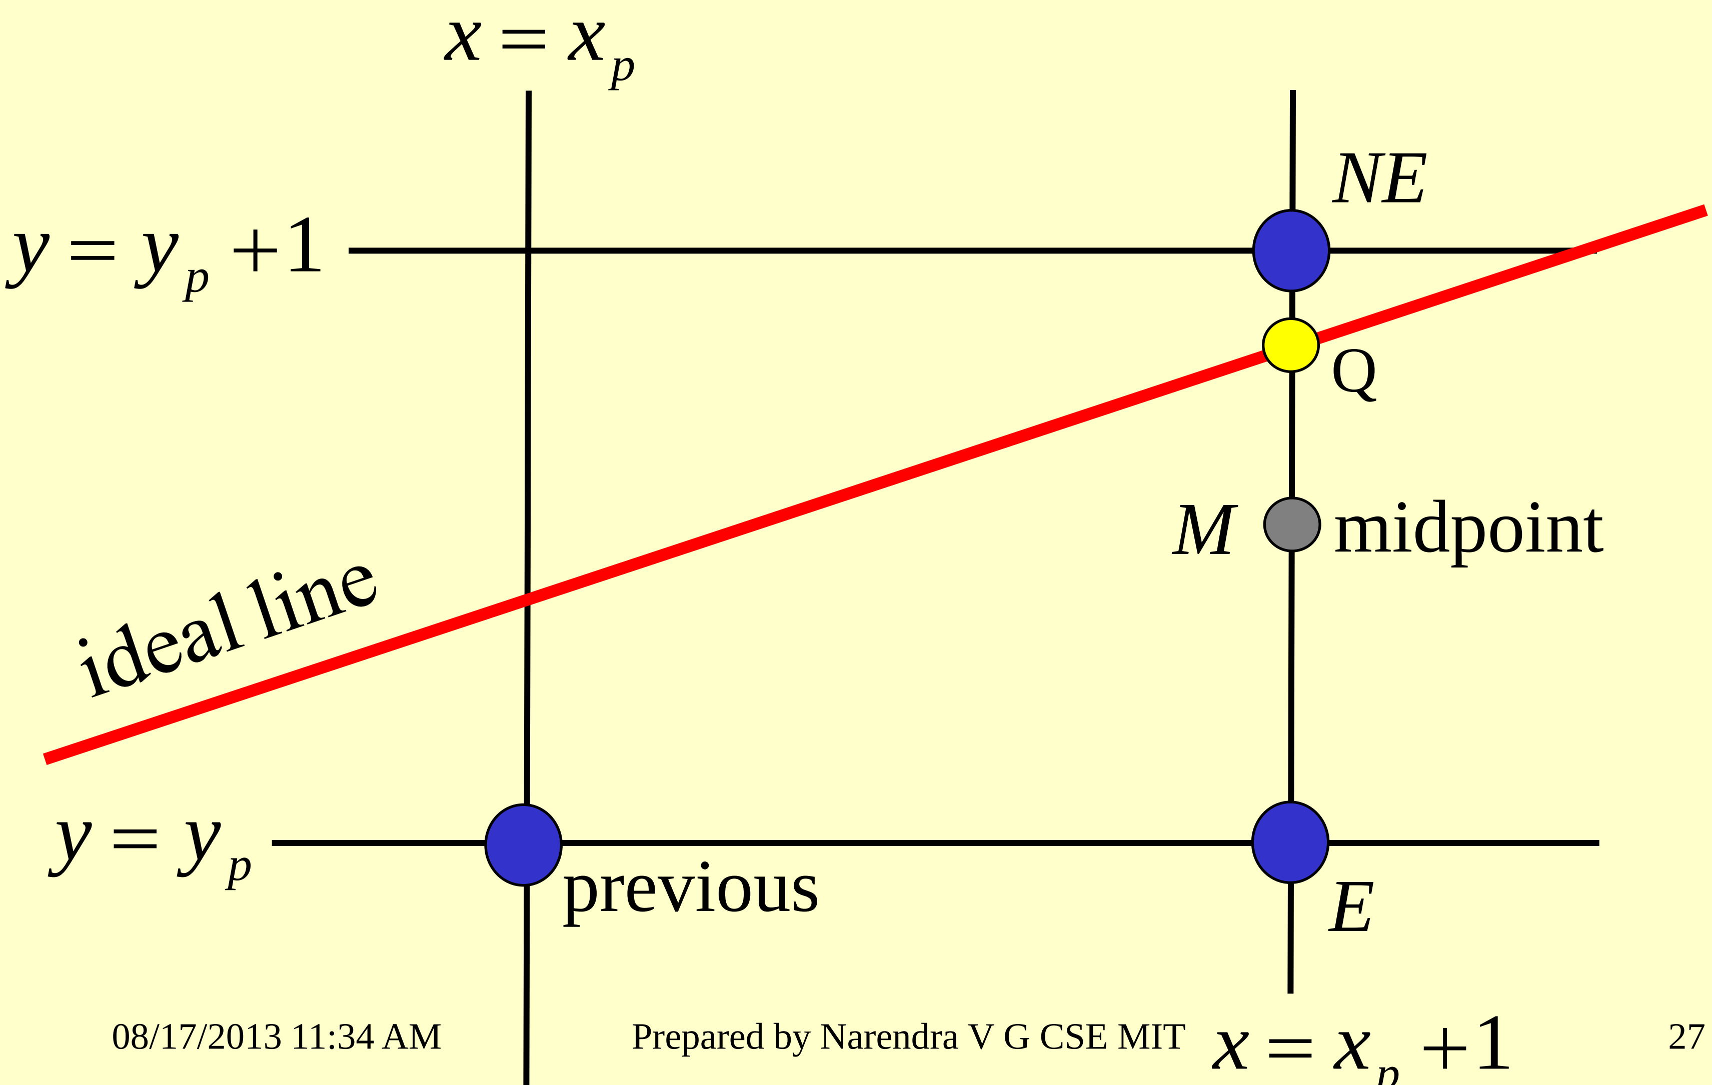
Define a logical *decision* variable d

– linear in form

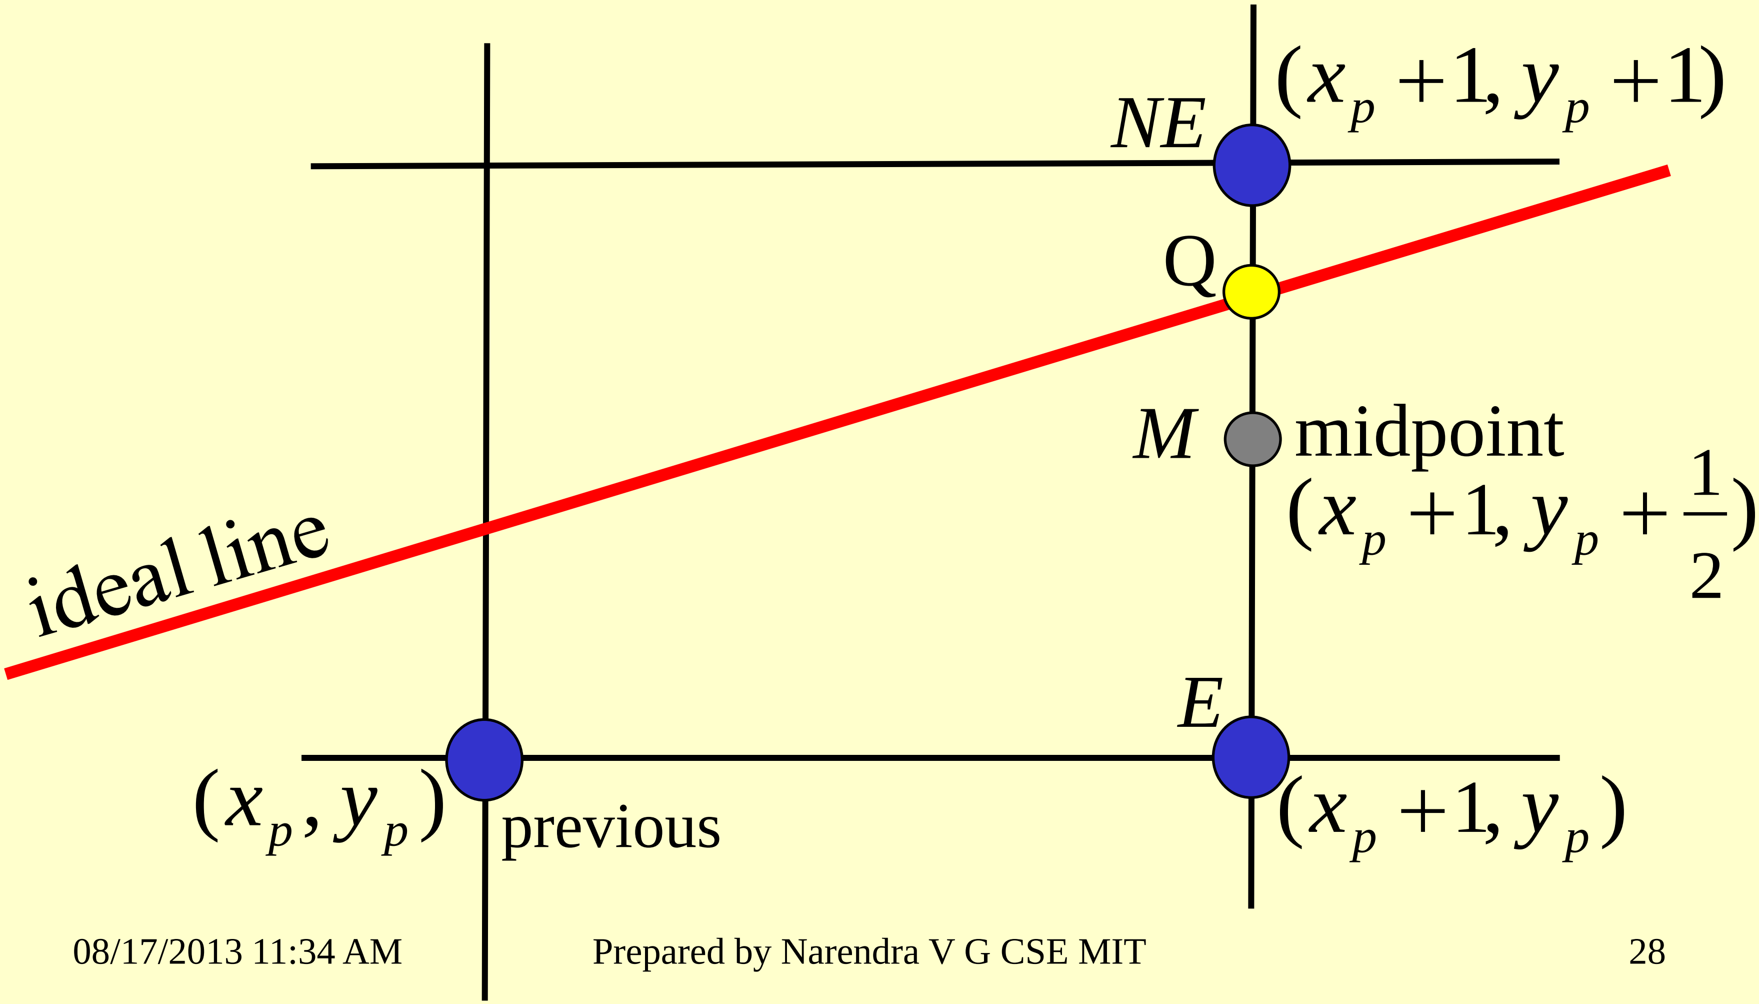
– incrementally updated (with addition)

– tells us whether to go *E* or *NE*

The Picture



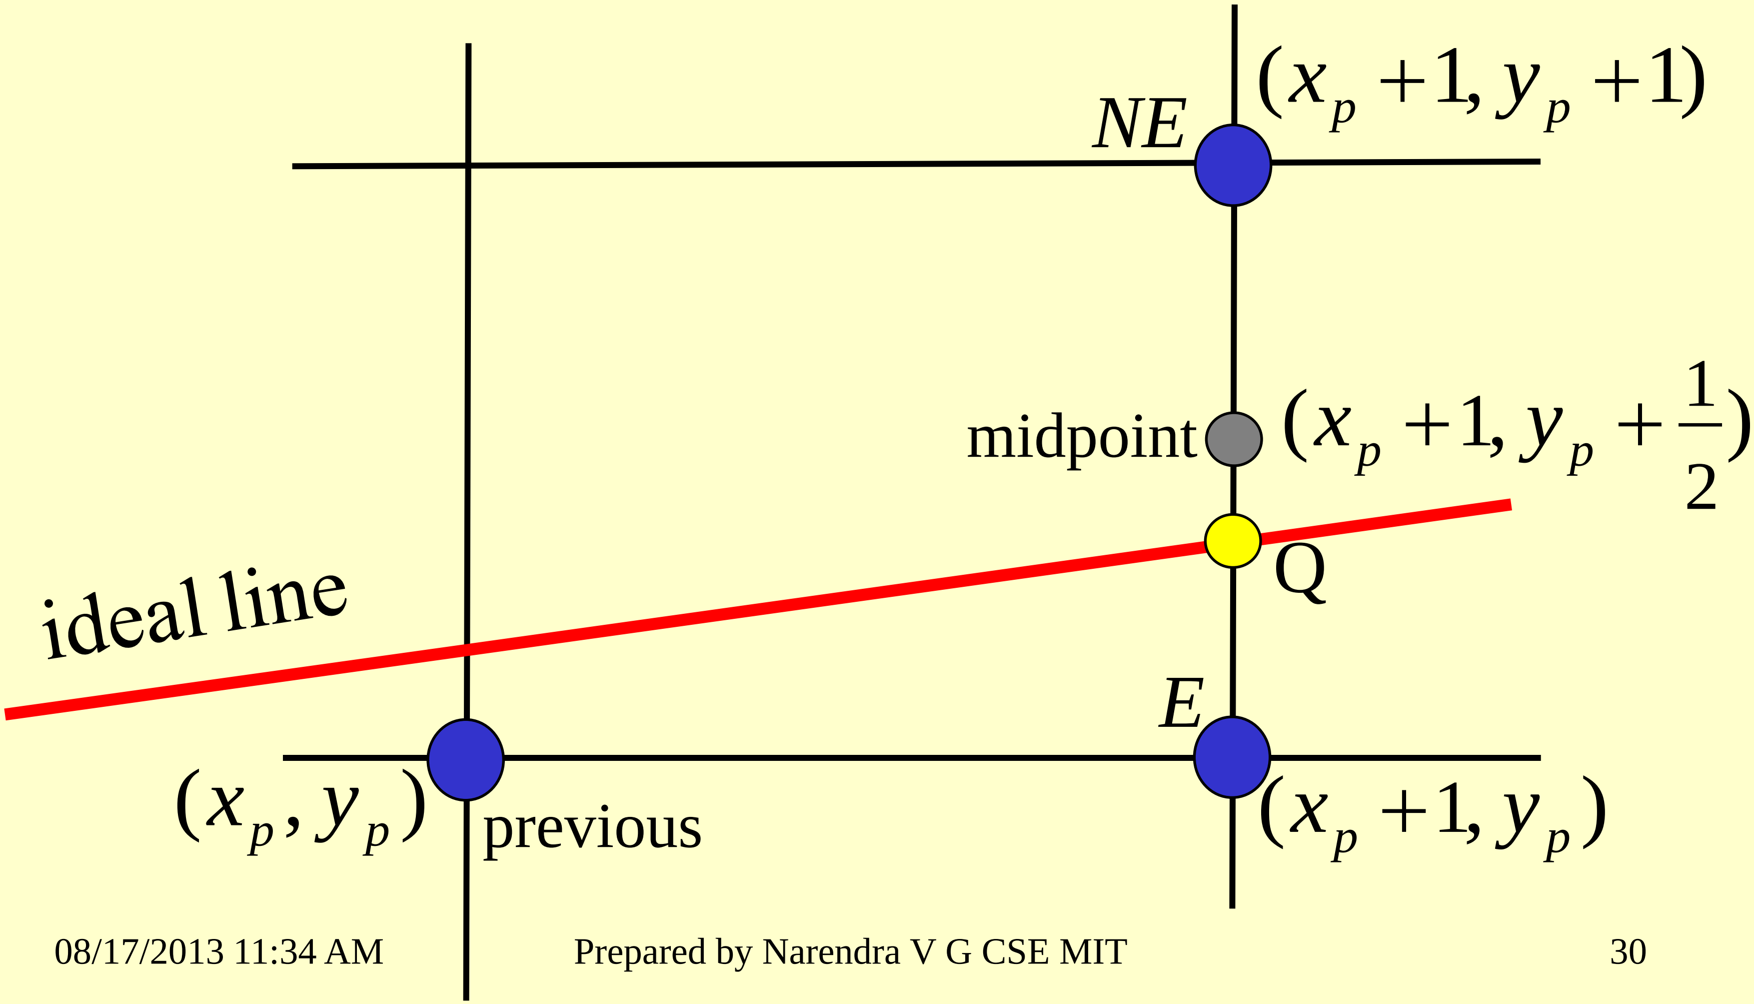
The Picture (again)



Observe the relationships

- Suppose Q is above M, as before.
- Then $F(M) > 0$, *M* is below the line
- So, $F(M) > 0$ means line is above M,
- Need to move *NE, increase y* value

The Picture (again)



Observe the relationships

- Suppose Q is below M, as before.
- Then $F(M) < 0$, implies M is *above* the line
- So, $F(M) < 0$, means line is below M,
- Need to move to *E; don't increase* y

M = Midpoint $= (x_p + 1, y_p + \frac{1}{2})$

- Want to evaluate at M
- Will use an incr *decision* var d
- Let, $d = F(x_p + 1, y_p + \frac{1}{2})$

$$d = a(x_p + 1) + b(y_p + \frac{1}{2}) + c$$

How will d be used?

Recall, $d = a(x_p + 1) + b(y_p + \frac{1}{2}) + c$

Therefore,

$$d = \begin{cases} > 0 & \Rightarrow NE \quad \text{(midpoint below ideal line)} \\ < 0 & \Rightarrow E \quad \text{(midpoint above ideal line)} \\ = 0 & \Rightarrow E \quad \text{(arbitrary)} \end{cases}$$

Case 1: Suppose E is chosen

- Recall $d_{old} = a(x_p + 1) + b(y_p + \frac{1}{2}) + c$
- $E \Rightarrow: \quad x \leftarrow x + 1; \quad y \leftarrow y,$
- $\therefore \ldots d_{new} = F(x_p + 2, y_p + \frac{1}{2})$

$$= a(x_p + 2) + b(y_p + \frac{1}{2}) + c$$

Case 1: Suppose E is chosen

$$d_{new} - d_{old} = \left(a(x_p + 2) + b(y_p + \frac{1}{2}) + c \right)$$

$$- \left(a(x_p + 1) + b(y_p + \frac{1}{2}) + c \right)$$

$$\boxed{d_{new} = d_{old} + a}$$

Review of Explicit to Implicit

Recall, $\frac{dy}{dx}x - y + B = 0$

Or, $(dy)x + (-dx)y + (dx)B = 0$

$$\therefore \quad F(x, y) = (dy)x + (-dx)y + (dx)B = 0$$

where, $a = (dy); \quad b = -(dx); \quad c = B(dx)$

Case 1: $d_{new} = d_{old} + a$

$\Delta_E \equiv$ increment we add if E is chosen.

So, $\Delta_E = a$. But remember that

$a = dy$ (from line equations).

Hence, $F(M)$ is not evaluated explicitly.

We simply add $\boxed{\Delta_E = a}$ to update d for E

Case 2: Suppose *NE* chosen

Recall $d_{old} = a(x_p + 1) + b(y_p + \frac{1}{2}) + c$

and, $NE \Rightarrow: \quad x \leftarrow x + 1; \quad y \leftarrow y + 1,$

$$\therefore \quad d_{new} = F(x_p + 2, y_p + \frac{3}{2})$$

$$= a(x_p + 2) + b(y_p + \frac{3}{2}) + c$$

Case 2: Suppose *NE*

$$d_{new} - d_{old} =$$

$$= \left(a(x_p + 2) + b(y_p + \frac{3}{2}) + c \right)$$

$$- \left(a(x_p + 1) + b(y_p + \frac{1}{2}) + c \right)$$

$$\boxed{d_{new} = d_{old} + a + b}$$

Case 2: $d_{new} = d_{old} + a + b$

$\Delta_{NE} \equiv$ increment that we add if NE is chosen.

So, $\Delta_{NE} = a + b.$ But remember that

$a = dy,$ and $b = -dx$ (from line equations).

Hence, $F(M)$ is not evaluated explicitly.

We simply add $\Delta_{NE} = a + b$ to update d for NE

Case 2: $d_{new} = d_{old} + a + b$

$\Delta_{NE} = a + b$, where $a = dy$, and $b = -dx$

means, we simply add $\Delta_{NE} = a + b$, i.e.,

$\boxed{\Delta_{NE} = dy - dx}$ to update d for NE.

Summary

- At each step of the procedure, we must choose between moving *E* or *NE* based on the sign of the decision variable d
- Then update according to

$$d \leftarrow \begin{cases} d + \Delta_E\ , \text{ where } \Delta_E = dy, \text{or} \\ d + \Delta_{NE}\ , \text{where } \Delta_{NE} = dy - dx \end{cases}$$

What is initial value of d ?

- First point is (x_0, y_0)
- First midpoint is $(x_0+1, y_0+\frac{1}{2})$
- What is initial midpoint value?

$$d(x_0+1, y_0+\frac{1}{2}) = F(x_0+1, y_0+\frac{1}{2})$$

What is initial value of d ?

$$F(x_0+1, y_0+\frac{1}{2}) = a(x_0+1) + b(y_0+\frac{1}{2}) + c$$

$$= \underline{\left(ax_0+by_0+c\right)} + \left(a+\frac{b}{2}\right)$$

$$= F(x_0, y_0) \quad + \quad \left(a+\frac{b}{2}\right)$$

What is initial value of d ?

Note, $F(x_0, y_0) = 0$, since (x_0, y_0) is on line.

Hence,

$$F(x_0 + 1, y_0 + \frac{1}{2}) = 0 + a + \frac{b}{2}$$

$$= (dy) - \left(\frac{dx}{2}\right)$$

What is initial value of d ?

Note, $F(x_0, y_0) = 0$, since (x_0, y_0) is on line.

Hence,

$$F(x_0 + 1, y_0 + \frac{1}{2}) = 0 + a + \frac{b}{2}$$

$$= (dy) - \left(\frac{dx}{2}\right)$$

What Does "2 x " Do ?

- Has the same 0-set

$$2F(x, y) = 2(ax + by + c) = 0$$

- Changes the slope of the plane
- Rotates plane about the 0-set line

What is initial value of d ?

Multiplying $F(x_0+1, y_0+\frac{1}{2}) = (dy) - \left(\frac{dx}{2}\right)$

by 2 gives,

$$2F(x_0+1, y_0+\frac{1}{2}) = 2(dy) - dx$$

What is initial value of d ?

$$2F(x, y) = 2(ax + by + c) = 0$$

So, first value of

$$\boxed{d = 2(dy) - (dx)}$$

More Summary

- Initial value $2(dy)-(dx)$
- Case 1: $d \leftarrow d + \Delta_E$, where $\Delta_E = 2(dy)$
- Case 2: $d \leftarrow d + \Delta_{NE}$,

  where $\Delta_{NE} = 2\{(dy)-(dx)\}$

More Summary

$$\text{Choose} \begin{cases} E & \text{if } d \leq 0 \\ NE & \text{otherwise} \end{cases}$$

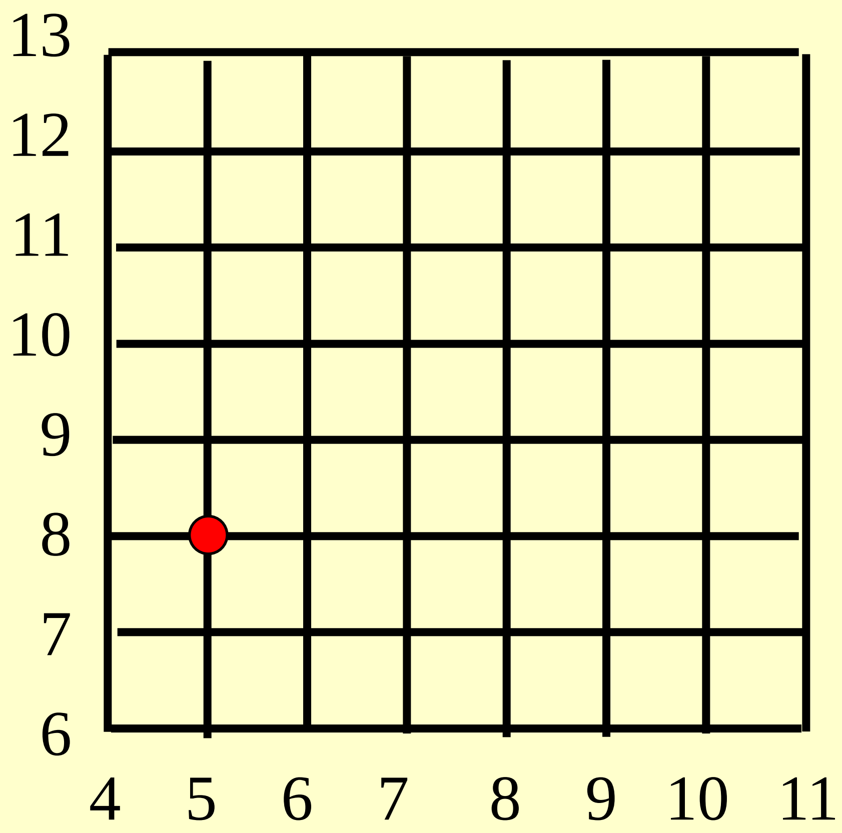
Example

- Line end points:

$$(x_0, y_0) = (5,8); \quad (x_1, y_1) = (9,11)$$

- Deltas: $dx = 4; dy = 3$

Graph



Example (dx = 4; dy = 3)

$$dx = 4; dy = 3$$

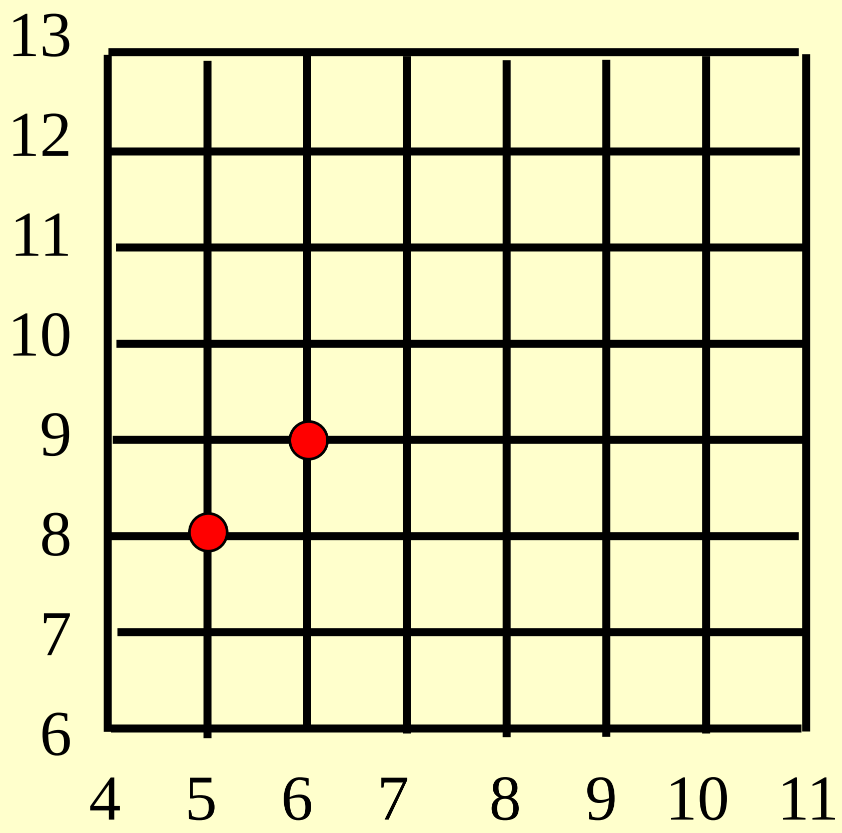
- Initial value of

$$d(5,8) = 2(2y)\text{-}(dx)$$

$$= 6 - 4 = 2 > 0$$

$$\boxed{d = 2 \quad \Rightarrow \quad NE}$$

Graph



Example ($dx = 4; \; dy = 3$)

- Update value of d
- Last move was NE, so

$$2d(6,9) = 2(dy\text{-}dx)$$

$$= 2(3 - 4) = -2$$

$$\boxed{d = 2 - 2 = 0 \quad \Rightarrow \quad E}$$

Example ($dx = 4;\ dy = 3$) -2

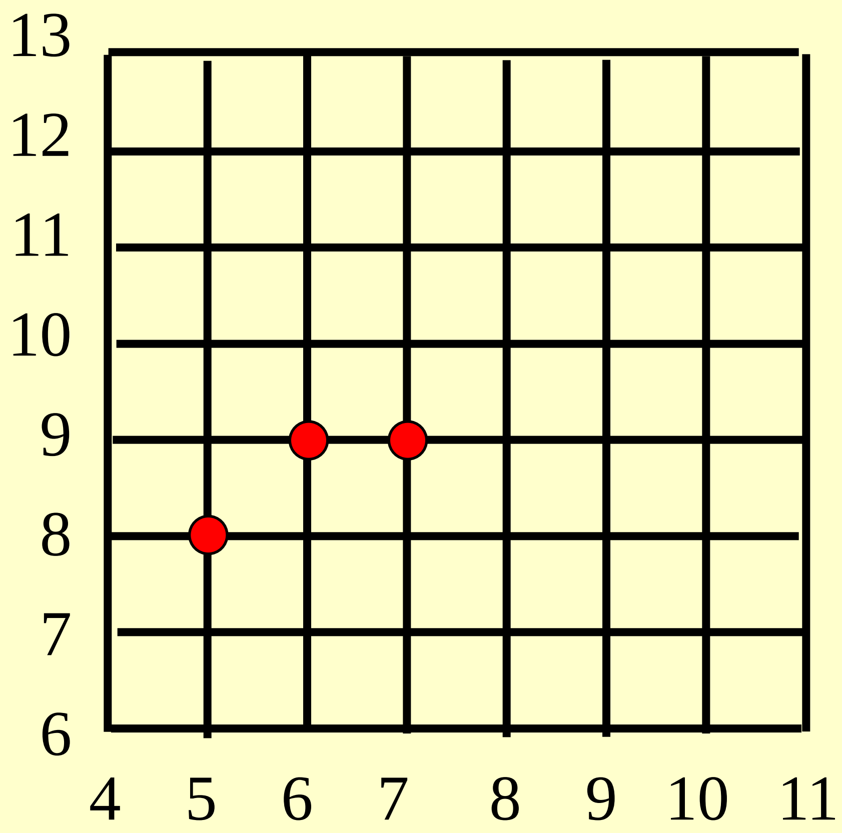
- Update value of d
- Last move was NE, so

$$2d(6,9) = 2d(y - dy)$$

$$= 2(4 - 3) = -2$$

$$d = 2 - 2 = 0 \quad \Rightarrow \ E$$

Graph



Example ($dx = 4;\ dy = 3$)

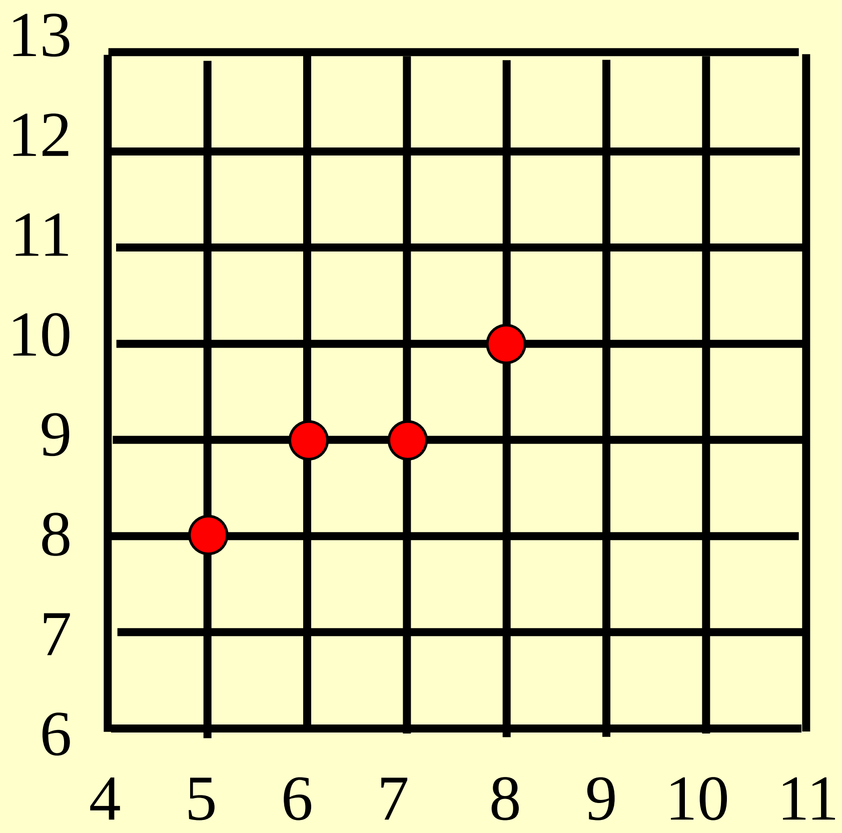
- Previous move was E

$$d(7,9) = 2(dy)$$

$$= 2(3) = 6$$

$$\boxed{d = 0 + 6 > 0 \quad \Rightarrow \quad NE}$$

Graph



Example $(dx = 4;\ dy = 3)$

- Previous move was NE, so

$$2d(8,10) = 2(dy - dx)$$

$$= 2(3 - 4) = -2$$

$$\boxed{d = 6 - 2 = 4 \quad \Rightarrow \quad NE}$$

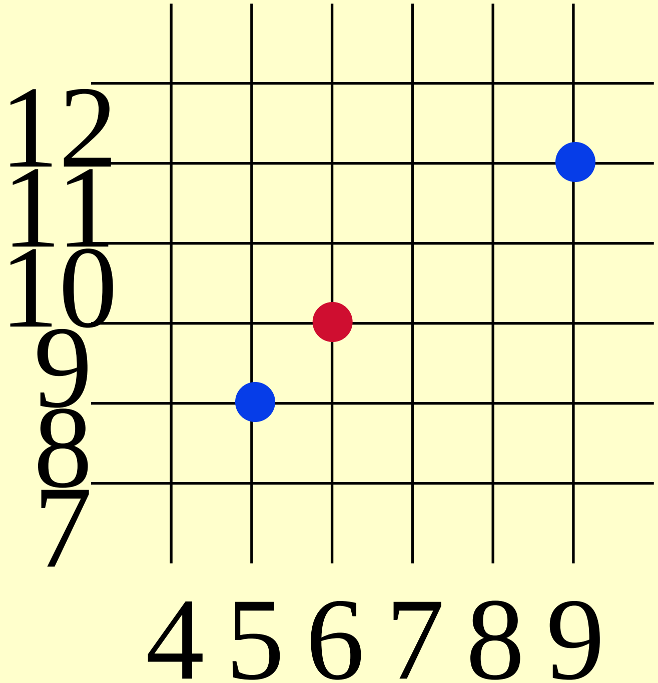
Midpoint Algorithm: The Code

```
void MidpointLine(int x0, int y0, int xn, int yn)
{
     int dx,dy,incrE,incrNE,d,x,y;
     dx=xn-x0;
     dy=yn-y0;
     d=2*dy-dx;    /* initial value of d */
     incrE=2*dy;         /* decision funct incr for E */
     incrNE=2*dy-2*dx;  /* decision funct incr for NE */
     x=x0;
     y=y0;
     DrawPixel(x,y)          /* draw the first pixel */
     while (x<xn){
          if (d<=0){        /* choose E */
               d+=incrE;
               x++;         /* move E */
          }else{            /* choose NE */
               d+=incrNE;
               x++;
               y++;         /* move NE */
          }
          DrawPixel (x,y);
     }
}
```

Midpoint Algorithm
An example



$(x_0, y_0) = (5, 8)$

$(x_4, y_4) = (9, 11)$

$\Delta x = 4$

$\Delta y = 3$

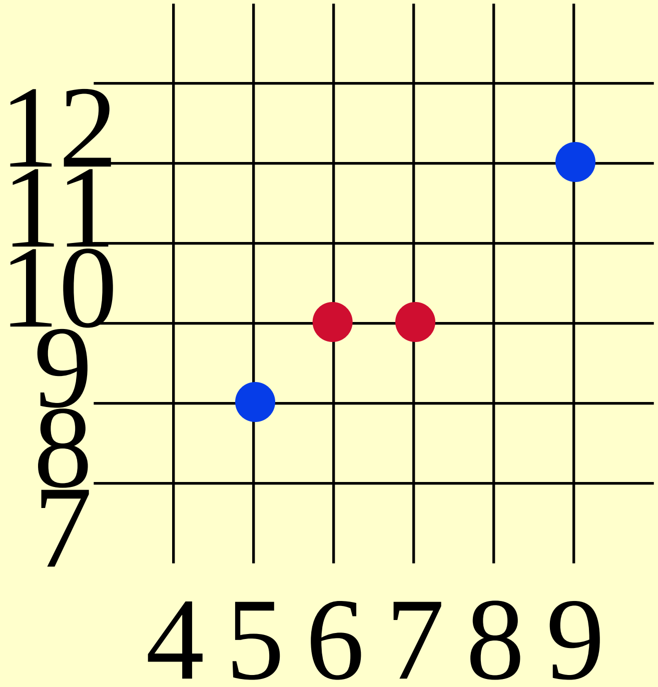
$incrE = 2\Delta y = 6$

$incrNE = 2(\Delta y - \Delta x) = -2$

$d_0 = 2\Delta y - \Delta x = 2$

$\therefore$ first choice is NE

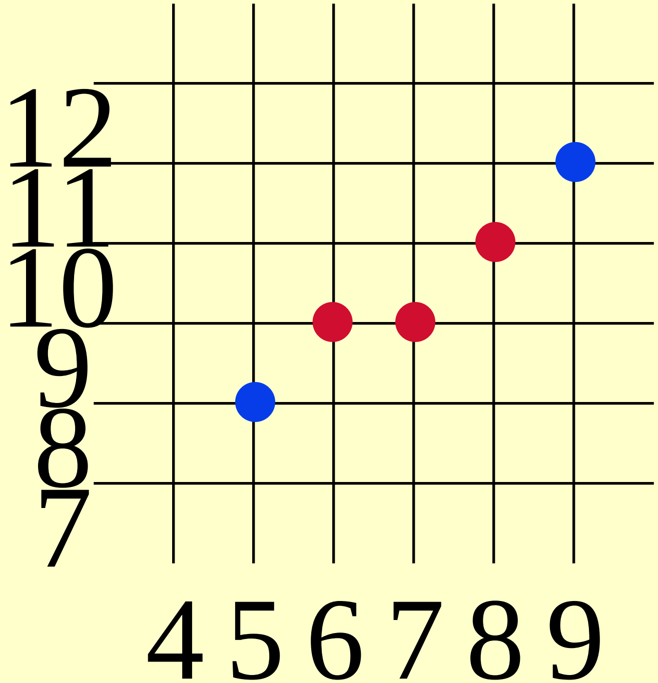
Midpoint Algorithm
An example



$$d_1 = d_0 + incrNE = 2 - 2 = 0$$

$\therefore$ second choice is E

Midpoint Algorithm
An example



$$d_2 = d_1 + incrE = 0 + 6 = 6$$

$\therefore$ third choice is NE
